

# HELP YOUR TREES SURVIVE DROUGHT!

Tree  
Care  
Tips

## MULCH

Trees love mulch! Mulch is rich in organic nutrients and helps during drought by:

- Retaining soil moisture
- Protecting tree roots
- Moderating soil temperature

Replace any turf under trees with mulch to reduce irrigation and maintenance needs. Apply a 2-4" thick layer under trees as far out as the drip line. Trees also grow better without turf and weeds competing for precious water!

*Mulch under trees improves tree health and reduces irrigation needs.*

## TREE HEALTH INVIGORATOR

Tree Health Invigorator is a soil amendment and tree health booster. It contains:

**Essential plus:** a 100% natural product derived from plant and animal materials.

**Biochar Vital Blend:** derived from renewable pine and naturally occurring humic shale, a source of nutrients and minerals.

Both products improve soil water-holding capacity, reducing irrigation needs. They also improve tree root growth and overall health, increasing water absorption and drought stress tolerance.

## TGR (Tree Growth Regulator)

TGR's are synthetic growth hormone blockers. A single treatment reduces tree growth by up to 80% over 3 years. By reducing growth, the tree now has more energy and resources to survive drought. TGR benefits include:

- Better root growth & water absorption
- Less leaf water loss
- Higher drought stress tolerance
- Less pruning needed. Saves money!
